

AYUSH SINGH

Managed Services Consultant | DevOps Engineer

Bangalore, KA | ayush054483@gmail.com | +91-9219064430 | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Managed Services Consultant supporting **application-support and reference-data engagements across four enterprise clients (EXP, BNS, LBP, ZTS) at Gresham Technology** — combining **Bloomberg/ADO data troubleshooting, Apache Airflow workflow automation, and DevOps practices across Kubernetes, Docker, Terraform, AWS, and CI/CD.**

CORE COMPETENCIES / KEYWORDS

- DevOps Tools: Kubernetes, Docker, Terraform, GitHub, Helm, Argo CD, Prometheus, AWS (EC2, S3, CloudWatch, Lambda, RDS, VPC, DynamoDB, IAM), Shell Script, Linux, Jenkins, SonarQube.

PROFESSIONAL EXPERIENCE

Managed Services Consultant

2026 – Present

Client Engagement: EXP (Managed Services)

- **Monitored production services and triaged application alerts** using **Grafana and log/alert-rule analysis, reducing mean time** to identify recurring incidents across the environment.
- **Traced application and data anomalies** — HTTP errors, validation failures, and suspect-data conditions — across production, **isolating root cause for cross-functional teams.**
- **Root-caused a warrant ADO matching-key issue across Bloomberg, N0, and C0 data layers**, tracing the record flow through normalization and consolidation, reproducing it in UAT, and confirming the fix before ticket closure.
- **Debugged Bloomberg/BDM security-builder workflows and batch-consolidation processing** across RAW, N0, and C0 data layers, analyzing processing logs to confirm job completion and catch errors during production support investigations.
- **Analyzed ADO relationships and Formula Engine (FE) attribute-calculation logic** within the **Prime EDM/XPCD data model**, supporting data-model changes across futures-related ADO mappings to **improve downstream data accuracy.**
- **Designed and built an automated transaction-reconciliation monitoring solution that extracts transaction records from source-system journal logs, consumes corresponding message-queue topics, and cross-references the two data streams to flag missing or mismatched records reducing manual validation effort and improving visibility** into data-pipeline integrity.

Client Engagement: BNS (Managed Services)

- **Built, modified, and validated Apache Airflow DAGs** — schedules, dependencies, sensors, and distribution jobs — across UAT and production, in line with business requirements.
- **Supported multiple concurrent Airflow-based data distribution and extraction workflows for enterprise clients.**

Client Engagement: LBP (Managed Services)

- **Developed and executed Formula Engine (FE) scripts** to extract and validate metadata across **173,000+ ADO records**, including **enabled/container status, validation scope and reference data.**
- **Turned that analysis into structured reports** used to track data quality across the client's reference-data platform.
- **Owned scheduled monitoring of outbound market-data feed file generation and delivery, investigating threshold-based missing-price alerts and coordinating with upstream data providers to restore feed completeness and reduce recurrence.**

Client Engagement: ZTS (Managed Services)

- **Administered Bloomberg reference-data configurations** (grid points, curve lists, static-attribute picklists) across UAT and Production, coordinating **multi-stakeholder approval gates** before each PRD promotion.
- **Diagnosed and resolved reference-data mapping defects**, including a bond-futures currency misclassification and **duplicate Bloomberg identifier collisions**, restoring accurate downstream data resolution.

EDUCATION

Bachelor's Degree in CSE — Sri Venkateshwara College of Engineering [2021-2025]

ACADEMIC PROJECT

AI-Driven DevSecOps CI/CD & GitOps Automation

- **Reduced the time of infrastructure installation by 30%** provisioning **AWS resources with Terraform** (IaC).
- Built a Jenkins-driven CI/CD pipeline achieving a **95% deployment success rate with zero downtime**.
- **Cut manual deployment** intervention by **80% integrating Argo CD for GitOps sync** between GitHub and EKS.
- **Reduced issue detection time by 40% with Prometheus + Grafana monitoring**.
- **Extended the DevSecOps pipeline with n8n + AI** for automated vulnerability triage across **4 priority levels (P1–P4)** and remediation notifications

Stack: Terraform · AWS · Jenkins · Docker · OWASP · SonarQube · Trivy · n8n · AI · Argo CD · Kubernetes · Prometheus · Grafana · Git

GitOps Microservices Platform — Amazon EKS Auto Mode

- Designed a **5-microservice architecture**; improved provisioning efficiency **40% via Terraform automation**.
- Maintained **99.5% uptime** running a **Java/Go/Node.js microservices framework on EKS Auto Mode**.
- **Accelerated deployment speed 50% using Docker + GitHub Actions CI/CD + automated ECR builds via Argo CD**.
- **Improved incident resolution time 45% through Prometheus monitoring** and structured logging.
- **Increased scalability 35% with Helm charts** for optimized resource allocation.

Stack: Terraform · Docker · GitHub Actions · Argo CD · Helm · Amazon EKS
